

CSE 214

Online on Creational Pattern

Time: 25 minutes

You are developing a logistics management application that handles different modes of transport. Currently, the system supports delivery by **Truck** and **Ship**. All transport modes implement a common interface **Transport** with a method **deliver()**.

As the business grows, you may need to add new transport types (e.g., Airplane or Train) in the future. The system needs to be flexible enough to instantiate the correct transport object based on the requested delivery mode (e.g., "Road" or "Sea") without modifying the client code that triggers the delivery.

Task: Implement the system where the client provides the transport type, and the system creates and returns the appropriate transport object to perform the delivery.

- You do not need to write complex logic inside **deliver()**; a simple print message is sufficient.
- Focus on the design structure that allows creating objects based on input.
