

CSE 214

Online on Creational Pattern

Time: 30 minutes

You are designing a module for a travel agency to build custom holiday packages. A holiday package consists of three main components: a **Flight**, a **Hotel**, and a **Daily Activity**.

The agency offers two standard package types:

1. **Relaxation Package:** Includes "Business Class Flight", "5-Star Resort", and "Spa Treatment".
2. **Adventure Package:** Includes "Economy Flight", "Mountain Cabin", and "Hiking Tour".

Task: You need to construct the final **HolidayPackage** object. Since the construction process involves multiple steps (selecting flight, selecting hotel, etc.), you must design a system that separates the construction of the complex object from its representation.

- You **don't** need to create separate classes for Flights or Hotels; use Strings to represent them.
- Ensure your design allows the creation of different package representations using the same construction process.
