Structural Design Pattern

Duration: 35 minutes

An e-commerce company sells gift items such as chocolates, mugs, perfumes, books, flowers, and many more. The company also offers several pre-defined gift packages, each consisting of one or more individual gift items.

On the occasion of Eid, the company introduces a new feature that allows customers to create and publish their own gift packages. These user-crafted packages will be stored in the company's repository and displayed alongside the company's predefined packages for others to purchase.

Customer-designed packages can be either a **Personal Gift Package**, intended for an individual recipient, or a **Corporate Gift Package**, intended to be distributed among employees of an organization.

Customers will create a package by adding two or more individual gift items and may also use existing packages of the company or packages created by other customers if they wish. Usually, the packages of the company are packed in a standard gift box, which adds no extra cost. For user-crafted packages, the company has introduced two additional packaging options:

- **Premium Gift Box** – adds \$15 and includes premium wrapping with a decorative ribbon.
- **Eco-Friendly Gift Box** – adds \$8 and uses recyclable materials.

The selected packaging style determines both the additional packaging cost and the presentation of the package. While creating a package, the customer must provide a name of the package, his/her name to be displayed as the creator of the package, and choose one packaging style.
